Patent No. 5977339
GENERAL INFORMATION:
APPLICANT: LeFebvre, Rance B.
APPLICANT: Perng, Guey-Chen
TITLE OF INVENTION: Methods and CITLE OF INVENTION: Lyme Disease
REGISTRATION NUMBER: 29,541
REFERENCE/DOCKET NUMBER: 2307
TELECOMMUNICATION INFORMATION:
TELEPHONE: 415-326-2400
TELEFAX: 415-326-2422
INFORMATION FOR SEQ ID NO: 2:
SEQUENCE CHARACTER STICS:
LENGTH: 700 amino acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Masuho Y., Kanehori K.;
"NEDO human CDNA sequencing project.";
Submitted (FEB-2000) to the EMBL/GenBank/DDBJ databases.
-1- FUNCTION: HAS DNA-DEPENDENT POLY[ADP-RIBOSE] POLYMERASE ACTIVITY.
SEEMS TO PLAY A ROLE IN THE RESPONSE TO DNA DAWAGE (By SIMILARITY).
-1- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-ribosyl}(N)-acceptor = nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.

-i- SUBCELLULAR LOCATION: NUCLEAT.

-i- SUBCELLULAR LOCATION: NUCLEAT.

-i- MISCELLANEOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUP ON A HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOLETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.

-i- SIMILARITY: BELONGS TO THE PARP FAMILY.

-i- SIMILARITY: CONTAINS 1 BRCT DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 29; Gaps

It is produced through a collaboration
                 CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

-!- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-TIDOSY1}(N)-acceptor -
nicotinamide + {ADP-D-TIDOSY1}(N+1)-acceptor -
-- COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
-!- SUBGNIT: HOMODIMER (POTENTIAL).
-!- SUBGNIT: HOMODIMER (POTENTIAL).
-!- SUBGRILULAR LOCATION: NUCLEAR.
-!- MISCELLANBOUS: THE ADP-D-RIBOSYL GROUP OF NAD(+) IS TRANSFERED TO AN ACCEPTOR CARBOXYL GROUPO NA HISTONE OR THE ENZYME ITSELF, AND FURTHER ADP-RIBOSYL GROUPS RE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOSINE MOLETY, BUILDING UP A POLYMER WITH AN AVERAGE CHARIN LENGTH OF 20-30 UNITS.
-!- SIMILARITY: BULONGS TO THE PARP FAMILY.
-!- SIMILARITY: CONTAINS 1 BRCT DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PROSITE; PS50172; BRCT; 1.

                                                                                                                        - TISSUE SPECIFICITY: PREDMINATLY EXPRESSED IN OVARY, OCCYTES, AND BRAIN. LOW IN LIVER.
- MISCELLANGOUS: THE ADP-D-RIBOSYL GROUD OF NAD(+) IS TRANSFERRED TO AN ACCEPTOR CARBOXYL GROUPS ARE TRANSFERRED TO THE 2'-POSITION OF THE TERMINAL ADENOISINE MOIETY, BUILDING UP A POLYMER WITH AN AVERAGE CHAIN LENGTH OF 20-30 UNITS.
- SIMILARITY: BELONGS TO THE PARP FAMILY.
- SIMILARITY: CONTAINS 1 BRCT DOMAIN.
     THE MODIFICATION IS DEPENDENT
PROTEINS BY POLY(ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND TUMOR TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

CATALYTIC ACTIVITY: NAD(+) + {ADP-D-TIDOSY}}(N)-acceptor - nicotinamide + {ADP-D-TIDOSY} (N+1)-acceptor.

COFACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PROSITE; PS50172; BRCT; 1.

Wirkner U., Mewes H.-W., Gassenhuber J., Wiemann S.;
Submitted (MAY-1999) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: NAD(+) + {ADD-D-ribosyl}(N)-acceptor =
nicotinamide + {ADP-D-ribosyl}(N+1)-acceptor.
-!- SUBCELJULAR LOCATION: Nuclear (Potential).
-!- TISSUE SPECIFICITY: Widely expressed; the highest levels are in the kidney, skeletal muscle, liver, heart and spleen; also detected in pancreas, lung, placenta, brain, leukocytes, colon, small intestine, ovary, testis, prostate and thymus.
-!- SIMILARITY: BELONGS TO THE PARP FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EIFQKKFLDKTKNNWEDREKFEKVPGKYDMLQMDYATNTQDEEETKKEESLKSPLKPESQ

Elochem. Biophys. Res. Commun. 193:119-125(1993).
- PROTEINS BY POLY (ADP-RIBOSYL)ATION. THE MODIFICATION IS DEPENDENT
ON DNA AND IS INVOLVED IN THE REGULATION OF VARIOUS IMPORTANT
CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND
CELLULAR PROCESSES SUCH AS DIFFERENTIATION, PROLIFERATION, AND
CHARGE TRANSFORMATION AND ALSO IN THE REGULATION OF THE MOLECULAR
EVENTS INVOLVED IN THE RECOVERY OF CELL FROM DNA DAMAGE.

- CATALYTIC ACTIVITY: NAD(+) + {ADP-D-TIDOSYL}{(N-1)-acceptor. = nicctinamide + {ADP-D-TIDOSYL}{(N-1)-acceptor. = nicctinamide + ADP-D-TIDOSYL](N-1)-acceptor.

- CORACTOR: ZINC, CONTAINS TWO MOLES OF ZINC PER MOLE OF PROTEIN.
- TISSUE SPECIFICITY: PREDOMINANTLY EXPRESSED IN OVARY, OCCYTES,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-OCT-1994 (Rel. 30, Created)
